

TDA7562

MULTIFUNCTION QUAD POWER AMPLIFIER WITH BUILT-IN DIAGNOSTICS FEATURES

- DMOS POWER OUTPUT
- HIGH OUTPUT POWER CAPABILITY 4x25W/4Ω @ 14.4V, 1KHZ, 10% THD, 4x35W EIAJ
- MAX. OUTPUT POWER 4x60W/2Ω
- FULL I²C BUS DRIVING:
 - ST-BY
 - INDEPENDENT FRONT/REAR SOFT PLAY/MUTE
 - SELECTABLE GAIN 30dB - 16dB (FOR LOW NOISE LINE OUTPUT FUNCTION)
 - I²C BUS DIGITAL DIAGNOSTICS
- FULL FAULT PROTECTION
- DC OFFSET DETECTION
- FOUR INDEPENDENT SHORT CIRCUIT PROTECTION
- CLIPPING DETECTOR PIN WITH SELECTABLE THRESHOLD (2%/10%)
- ST-BY/MUTE PIN
- ESD PROTECTION

DESCRIPTION

The TDA7562 is a new BCD technology QUAD BRIDGE type of car radio amplifier in Flexiwatt27

BLOCK DIAGRAM

MULTIPOWER BCD TECHNOLOGY

MOSFET OUTPUT POWER STAGE

FLEXIWATT27

package specially intended for car radio applications. Thanks to the DMOS output stage the TDA7562 has a very low distortion allowing a clear powerful sound.

This device is equipped with a full diagnostics array that communicates the status of each speaker through the I²C bus.

The possibility to control the configuration and the behaviour of the device by means of the I²C bus makes TDA7562 a very flexible machine.

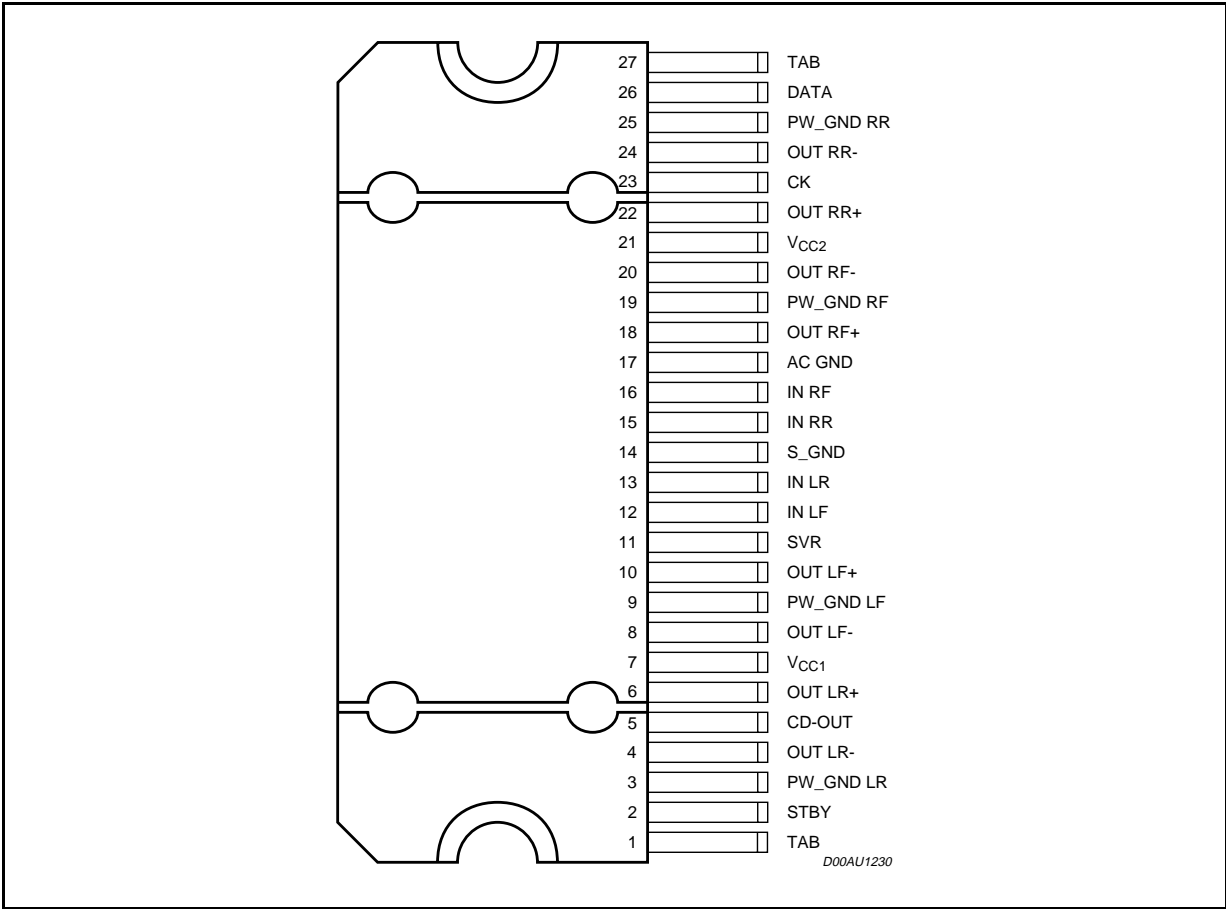

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _{op}	Operating Supply Voltage	18	V
V _S	DC Supply Voltage	28	V
V _{peak}	Peak Supply Voltage (for t = 50ms)	50	V
V _{CK}	CK pin Voltage	6	V
V _{DATA}	Data Pin Voltage	6	V
I _O	Output Peak Current (not repetitive t = 100μs)	8	A
I _O	Output Peak Current (repetitive f > 10Hz)	6	A
P _{tot}	Power Dissipation T _{case} = 70°C	85	W
T _{stg} , T _j	Storage and Junction Temperature	-55 to 150	°C

THERMAL DATA

DIAGNOSTICS FUNCTIONAL DESCRIPTION

Detectable conventional faults are:

- SHORT TO GND
- SHORT TO V_s
- SHORT ACROSS THE SPEAKER

The following additional features are provided:

- OUTPUT OFFSET DETECTION

The TDA7562 has 2 operating statuses:

1) **RESTART mode.** The diagnostic is not enabled. Each audio channel operates independently from each other. If any of the a.m. faults occurs, only the channel(s) interested is shut down. A check of the output status is made every 1 ms (fig. 14). Restart takes place when the overload is removed.

2) **DIAGNOSTIC mode.** It is enabled via I2C bus and self activates if an output overload (such to cause the intervention of the short-circuit protection) occurs to the speakers outputs. Once activated, the diagnostics procedure develops as follows (fig. 15):

low (fig. 15):

- To avoid momentary re-circulation spikes from giving erroneous diagnostics, a check of the output status is made after 1ms: if normal situation (no overloads) is detected, the diagnostic is not performed and the channel returns back active.

- Instead, if an overload is detected during the check after 1 ms, then a diagnostic cycle having a duration of about 100 ms is started.

- After a diagnostic cycle, the audio channel interested by the fault is switched to RESTART mode. The relevant data are stored inside the device and can be read by the microprocessor. When one cycle has terminated, the next one is activated by an I2C reading. This is to ensure continuous diagnostics throughout the car-radio operating time.

- To check the status of the device a sampling system is needed. The timing is chosen at microprocessor level (over half a second is recommended).

Figure 14. Restart timing without Diagnostic Enable

Each 1mS time, a sampling of the fault is done

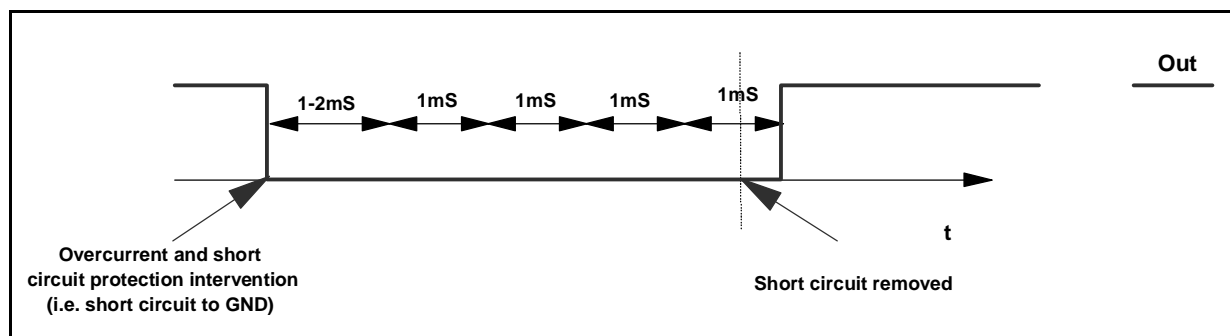

Figure 15. Restart timing with Diagnostic Enable

As for SHORT TO GND / V_S the fault-detection thresholds remain unchanged from 30 dB to 16 dB gain setting. They are as follows:

Concerning SHORT ACROSS THE SPEAKER, the threshold varies from 30 dB to 16 dB gain setting, since different loads are expected (either normal speaker's impedance or high impedance). The values in case of 30 dB gain are as follows:

If the Line-Driver mode ($G_v = 16$ dB and Line Driver Mode diagnostic = 1) is selected, the same thresholds will change as follows:

OUTPUT DC OFFSET DETECTION.

Any DC output offset exceeding ± 2 V are signalled out. This inconvenient might occur as a consequence of initially defective or aged and worn-out input capacitors feeding a DC component to the inputs, so putting the speakers at risk of overheating.

This diagnostic has to be performed with low-level output AC signal (or $V_{in} = 0$).

The test is run with selectable time duration by microprocessor (from a "start" to a "stop" command):

START = Last reading operation or setting IB1 - D5 - (OFFSET enable) to 1

STOP = Actual reading operation

Excess offset is signalled out if persistent throughout the assigned testing time. This feature is disabled if any overloads leading to activation of the short-circuit protection occurs in the process.

MULTIPLE FAULTS.

When more misconnections are simultaneously in place at the audio outputs, it is guaranteed that at least one of them is initially read out. The others are notified after successive cycles of I²C reading and faults removal, provided that the diagnostic is

enabled.

The table below shows all the couples of double-fault possible. It should be taken into account that a short circuit with the 4 ohm speaker unconnected is considered as double fault.

Double fault table for Diagnostics				
	S. GND (so)	S. GND (sk)	S. Vs	S. Across L.
S. GND (so)	S. GND	S. GND	S. Vs + S. GND	S. GND
S. GND (sk)	/	S. GND	S. Vs	S. GND
S. Vs	/	/	S. Vs	S. Vs
S. Across L.	/	/	/	S. Across L.

S. GND (so) / S. GND (sk) in the above table make a distinction according to which of the 2 outputs is shorted to ground (test-current source side= so, test-current sink side = sk). More precisely, so = CH+, sk = CH-.

FAULTS AVAILABILITY

All the results coming from I²Cbus, by read operations, are the consequence of measurements inside a defined period of time. If the fault is stable throughout the whole period, it will be sent out.

To guarantee always resident functions, every kind of diagnostic cycles will be reactivate after any I²C reading operation. So, when the micro reads the I²C, a new cycle will be able to start, but the read data will come from the previous diag. cycle (i.e. The device is in turned On, with a short to Gnd, then the short is removed and micro reads I²C. The short to Gnd is still present in bytes, because it is the result of the previous cycle. If another I²C reading operation occurs, the bytes do not show the short). In general to observe a change in Diagnostic bytes, two I²C

reading operations are necessary.

I²C PROGRAMMING/READING SEQUENCE

A correct turn on/off sequence respectful of the diagnostic timings and producing no audible noises could be as follows (after battery connection):

TURN-ON: PIN2 > 7V --- 10ms --- (STAND-BY OUT + DIAG ENABLE) --- 500 ms (min) --- MUTING OUT

TURN-OFF: MUTING IN --- 20 ms --- (DIAG DISABLE + STAND-BY IN) --- 10ms --- PIN2 = 0

Car Radio Installation: PIN2 > 7V --- 10ms DIAG ENABLE (write) --- 200 ms --- I²C read (repeat until All faults disappear).

OFFSET TEST: Device in Play (no signal) -- OFFSET ENABLE - 30ms - I²C reading (repeat I²C reading until high-offset message disappears).

I²C BUS INTERFACE

Data transmission from microprocessor to the TDA7562 and viceversa takes place through the 2 wires I²C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

Data Validity

As shown by fig. 16, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

Start and Stop Conditions

As shown by fig. 17 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH.

The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

Byte Format

Every byte transferred to the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

Acknowledge

The transmitter* puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 18). The receiver** the acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

* Transmitter

- = master (μP) when it writes an address to the TDA7562
- = slave (TDA7562) when the μP reads a data byte from TDA7562

** Receiver

- = slave (TDA7562) when the μP writes an address to the TDA7562
- = master (μP) when it reads a data byte from TDA7562

TDA7562

SOFTWARE SPECIFICATIONS

All the functions of the TDA7562 are activated by I²C interface.

The bit 0 of the "ADDRESS BYTE" defines if the next bytes are write instruction (from μ P to TDA7562) or read instruction (from TDA7562 to μ P).

Chip Address:

D7							D0
1	1	0	1	1	0	0	X

D8 Hex

X = 0 Write to device

X = 1 Read from device

If R/W = 0, the μ P sends 2 "Instruction Bytes": IB1 and IB2.

IB1

D7	X
D6	Diagnostic enable (D6 = 1) Diagnostic defeat (D6 = 0)
D5	Offset Detection enable (D5 = 1) Offset Detection defeat (D5 = 0)
D4	Front Channel Gain = 30dB (D4 = 0) Gain = 16dB (D4 = 1)
D3	Rear Channel Gain = 30dB (D3 = 0) Gain = 16dB (D3 = 1)
D2	Mute front channels (D2 = 0) Unmute front channels (D2 = 1)
D1	Mute rear channels (D1 = 0) Unmute rear channels (D1 = 1)
D0	CD 2% (D0 = 0) CD 10% (D0 = 1)

IB2

D7	X
D6	used for testing
D5	used for testing
D4	Stand-by on - Amplifier not working - (D4 = 0) Stand-by off - Amplifier working - (D4 = 1)
D3	Power amplifier mode diagnostic (D3 = 0) Line driver mode diagnostic (D3 = 1)
D2	X
D1	X
D0	X

If R/W = 1, the TDA7562 sends 4 "Diagnostics Bytes" to μ P: DB1, DB2, DB3 and DB4.

DB1

D7	Thermal warning active (D7 = 1)
D6	Diag. cycle not activated or not terminated (D6 = 0) Diag. cycle terminated (D6 = 1)
D5	X
D4	X
D3	Channel LF Normal load (D3 = 0) Short load (D3 = 1)
D2	Channel LF No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel LF No short to Vcc (D1 = 0) Short to Vcc (D1 = 1)
D0	Channel LF No short to GND (D1 = 0) Short to GND (D1 = 1)

DB2

D7	Offset detection not activated (D7 = 0) Offset detection activated (D7 = 1)
D6	X
D5	X
D4	X
D3	Channel LR Normal load (D3 = 0) Short load (D3 = 1)
D2	Channel LR No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel LR No short to Vcc (D1 = 0) Short to Vcc (D1 = 1)
D0	Channel LR No short to GND (D1 = 0) Short to GND (D1 = 1)

DB3

D7	Stand-by status (= IB1 - D4)
D6	Diagnostic status (= IB1 - D6)
D5	X
D4	Channel RF Turn-on diagnostic (D4 = 0) X
D3	Channel RF Normal load (D3 = 0) Short load (D3 = 1)
D2	Channel RF No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel RF No short to Vcc (D1 = 0) Short to Vcc (D1 = 1)
D0	Channel RF No short to GND (D1 = 0) Short to GND (D1 = 1)

DB4

D7	X
D6	X
D5	X
D4	X
D3	Channel RR Normal load (D3 = 0) Short load (D3 = 1)
D2	Channel RR No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel RR No short to Vcc (D1 = 0) Short to Vcc (D1 = 1)
D0	Channel RR No short to GND (D1 = 0) Short to GND (D1 = 1)

Examples of bytes sequence

1 - Turn-On of the power amplifier with 30dB gain, mute on, diagnostic defeat, CD = 2%.

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			X0000000		XXX1XXXX		

2 - Turn-Off of the power amplifier

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			X0XXXXXX		XXX0XXXX		

3 - Offset detection procedure enable

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			XX1XX11X		XXX1XXXX		

4 - Offset detection procedure stop and reading operation (the results are valid only for the offset detection bits (D2 of the bytes DB1, DB2, DB3, DB4).

Start	Address byte with D0 = 1	ACK	DB1	ACK	DB2	ACK	DB3	ACK	DB4	ACK	STOP
-------	--------------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	------

- The purpose of this test is to check if a D.C. offset (2V typ.) is present on the outputs, produced by input capacitor with anomalous leakage current or humidity between pins.
- The delay from 3 to 4 can be selected by software, starting from T.B.D. ms
