Functional Description

TLE 4264 G is a 5-V low-drop fixed-voltage regulator in an SOT-223 package. The IC regulates an input voltage V_i in the range $5.5\text{ V} < V_i < 45\text{ V}$ to $V_{\text{Qrated}} = 5.0\text{ V}$. The maximum output current is more than 120 mA. This IC is shortcircuit-proof and features temperature protection that disables the circuit at overtemperature.

Dimensioning Information on External Components

The input capacitor C_i is necessary for compensating line influences. Using a resistor of approx. $1\ \Omega$ in series with C_i , the oscillating of input inductivity and input capacitance can be clamped. The output capacitor C_o is necessary for the stability of the regulating circuit. Stability is guaranteed at values $C_o \geq 10\ \mu\text{F}$ and an $\text{ESR} \leq 10\ \Omega$ within the operating temperature range.

Pin Definitions and Functions

Pin	Symbol	Function
1	V_I	Input voltage; block to ground directly on IC with ceramic capacitor
2, 4	GND	Ground
3	V_Q	5-V output voltage; block to ground with $\geq 10\text{-}\mu\text{F}$ capacitor, $\text{ESR} < 10\ \Omega$

Circuit Description

The control amplifier compares a reference voltage, which is kept highly precise by resistance adjustment, to a voltage that is proportional to the output voltage and drives the base of the series transistor via a buffer. Saturation control, working as a function of load current, prevents any over-saturation of the power element. The IC is additionally protected against overload, overtemperature and reverse polarity.
