

TPS70345, TPS70348, TPS70351, TPS70358, TPS70302 DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS WITH POWER UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS285A – AUGUST 2000 – REVISED OCTOBER 2002

- Dual Output Voltages for Split-Supply Applications
- Selectable Power Up Sequencing for DSP Applications (See TPS704xx for Independent Enabling of Each Output)
- Output Current Range of 1 A on Regulator 1 and 2 A on Regulator 2
- Fast Transient Response
- Voltage Options Are 3.3-V/2.5-V, 3.3-V/1.8-V, 3.3-V/1.5-V, 3.3-V/1.2-V, and Dual Adjustable Outputs
- Open Drain Power-On Reset With 120-ms Delay
- Open Drain Power Good for Regulator 1
- Ultralow 185 μ A (typ) Quiescent Current
- 2 μ A Input Current During Standby
- Low Noise: 78 μ V_{RMS} Without Bypass Capacitor
- Quick Output Capacitor Discharge Feature
- Two Manual Reset Inputs
- 2% Accuracy Over Load and Temperature
- Undervoltage Lockout (UVLO) Feature
- 24-Pin PowerPAD™ TSSOP Package
- Thermal Shutdown Protection

description

TPS703xx family of devices are designed to provide a complete power management solution for TI DSP, processor power, ASIC, FPGA, and digital applications where dual output voltage regulators are required. Easy programmability of the sequencing function makes this family ideal for any TI DSP applications with power sequencing requirement. Differentiated features, such as accuracy, fast transient response, SVS supervisory circuit (power on reset), manual reset inputs, and enable function, provide a complete system solution.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS

WITH POWER UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS285A – AUGUST 2000 – REVISED OCTOBER 2002

description (continued)

The TPS703xx family of voltage regulators offers very low dropout voltage and dual outputs with power up sequence control, which is designed primarily for DSP applications. These devices have low noise output performance without using any added filter bypass capacitors and are designed to have a fast transient response and be stable with 47 μ F low ESR capacitors.

These devices have fixed 3.3-V/2.5-V, 3.3-V/1.8-V, 3.3-V/1.5-V, 3.3-V/1.2-V, and adjustable voltage options. Regulator 1 can support up to 1 A, and regulator 2 can support up to 2 A. Separate voltage inputs allow the designer to configure the source power.

Because the PMOS pass element behaves as a low-value resistor, the dropout voltage is very low (typically 160 mV on regulator 1) and is directly proportional to the output current. Additionally, since the PMOS pass element is a voltage-driven device, the quiescent current is very low and independent of output loading (maximum of 250 μ A over the full range of output current). This LDO family also features a sleep mode; applying a high signal to $\overline{\text{EN}}$ (enable) shuts down both regulators, reducing the input current to 1 μ A at $T_J = 25^\circ\text{C}$.

The device is enabled when the $\overline{\text{EN}}$ pin is connected to a low-level input voltage. The output voltages of the two regulators are sensed at the V_{SENSE1} and V_{SENSE2} pins respectively.

The input signal at the SEQ pin controls the power-up sequence of the two regulators. When the device is enabled and the SEQ terminal is pulled high or left open, V_{OUT2} turns on first and V_{OUT1} remains off until V_{OUT2} reaches approximately 83% of its regulated output voltage. At that time V_{OUT1} is turned on. If V_{OUT2} is pulled below 83% (i.e. overload condition) of its regulated voltage, V_{OUT1} will be turned off. Pulling the SEQ terminal low reverses the power-up order and V_{OUT1} is turned on first. The SEQ pin is connected to an internal pullup current source.

For each regulator, there is an internal discharge transistor to discharge the output capacitor when the regulator is turned off (disabled).

The PG1 pin reports the voltage conditions at V_{OUT1} . The PG1 pin can be used to implement a SVS (power on reset) for the circuitry supplied by regulator 1.

The TPS703xx features a $\overline{\text{RESET}}$ (SVS, POR, or power on reset). $\overline{\text{RESET}}$ is an active low, open drain output and requires a pullup resistor for normal operation. When pulled up, $\overline{\text{RESET}}$ goes to a high impedance state (i.e. logic high) after a 120 ms delay when all three of the following conditions are met. First, V_{IN1} must be above the undervoltage condition. Second, the manual reset ($\overline{\text{MR}}$) pin must be in a high impedance state. Third, V_{OUT2} must be above approximately 95% of its regulated voltage. To monitor V_{OUT1} , the PG1 output pin can be connected to $\overline{\text{MR1}}$ or $\overline{\text{MR2}}$. $\overline{\text{RESET}}$ can be used to drive power on reset or a low-battery indicator. If $\overline{\text{RESET}}$ is not used, it can be left floating.

Internal bias voltages are powered by V_{IN1} and require 2.7 V for full functionality. Each regulator input has an undervoltage lockout circuit that prevents each output from turning on until the respective input reaches 2.5 V.

AVAILABLE OPTIONS

T_J	REGULATOR 1 V_O (V)	REGULATOR 2 V_O (V)	TSSOP (PWP)
-40°C to 125°C	3.3 V	1.2 V	TPS70345PWP
	3.3 V	1.5 V	TPS70348PWP
	3.3 V	1.8 V	TPS70351PWP
	3.3 V	2.5 V	TPS70358PWP
	Adjustable (1.22 V to 5.5 V)	Adjustable (1.22 V to 5.5 V)	TPS70302PWP

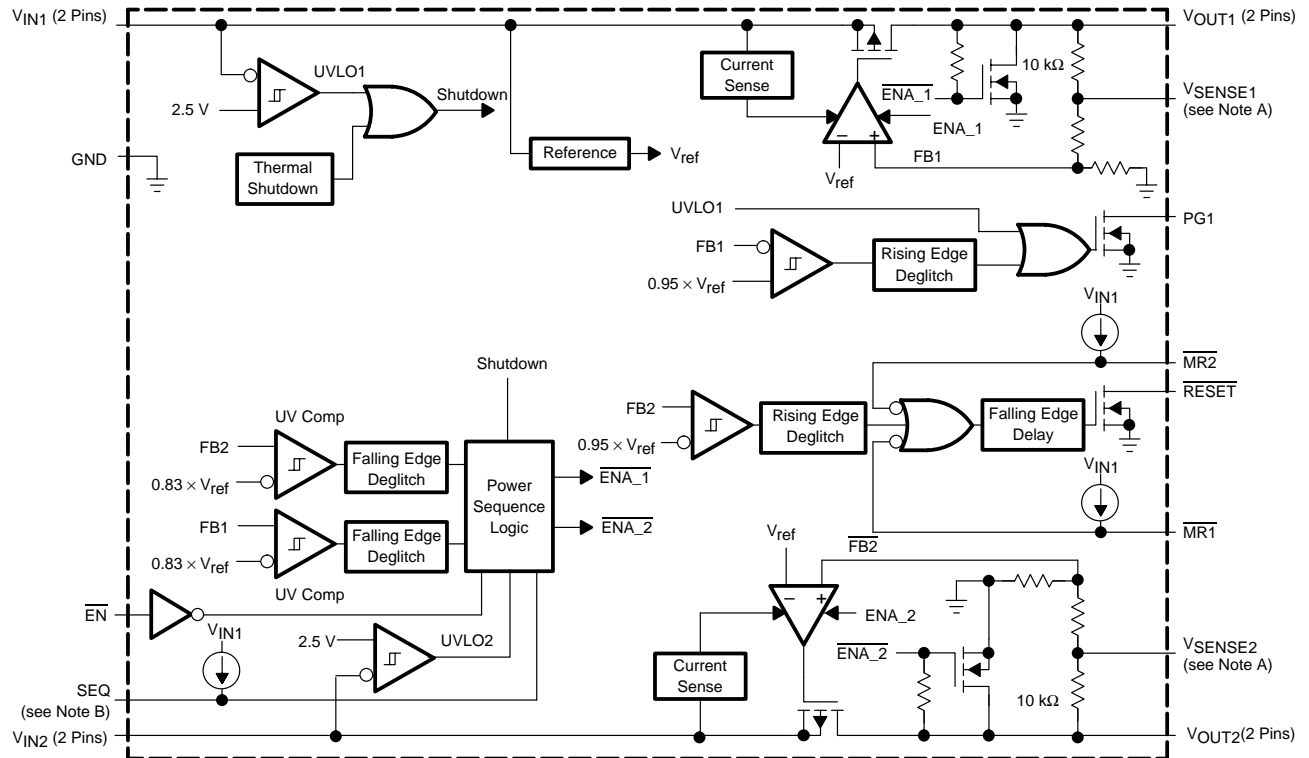

NOTE: The TPS70302 is programmable using external resistor dividers (see application information) The PWP package is available taped and reeled. Add an R suffix to the device type (e.g., TPS70302PWPR).

WITH POWER UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS285A – AUGUST 2000 – REVISED OCTOBER 2002

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
EN	7	I	Active low enable
GND	9		Regulator ground
GND/HEATSINK	1, 12, 13, 24		Ground/heatsink
MR1	6	I	Manual reset input 1, active low, pulled up internally
MR2	5	I	Manual reset input 2, active low, pulled up internally
NC	4, 17, 20		No connection
PG1	19	O	Open drain output, low when V_{OUT1} voltage is less than 95% of the nominal regulated voltage
RESET	18	O	Open drain output, SVS (power on reset) signal, active low
SEQ	8	I	Power up sequence control: SEQ=High, V_{OUT2} powers up first; SEQ=Low, V_{OUT1} powers up first, SEQ terminal pulled up internally.
V_{IN1}	2, 3	I	Input voltage of regulator 1
V_{IN2}	10, 11	I	Input voltage of regulator 2
V_{OUT1}	22, 23	O	Output voltage of regulator 1
V_{OUT2}	14, 15	O	Output voltage of regulator 2
$V_{SENSE2}/FB2$	16	I	Regulator 2 output voltage sense/ regulator 2 feedback for adjustable
$V_{SENSE1}/FB1$	21	I	Regulator 1 output voltage sense/ regulator 1 feedback for adjustable

detailed description

The TPS703xx low dropout regulator family provides dual regulated output voltages for DSP applications that require a high performance power management solution. These devices provide fast transient response and high accuracy, while drawing low quiescent current. Programmable sequencing provides a power solution for DSPs without any external component requirements. This reduces the component cost and board space while increasing total system reliability. TPS703xx family has an enable feature which puts the device in sleep mode reducing the input current to 1 μ A. Other features are the integrated SVS (power on reset, RESET) and power good (PG1). These monitor output voltages and provide logic output to the system. These differentiated features provide a complete DSP power solution.

The TPS703xx, unlike many other LDOs, features very low quiescent current which remains virtually constant even with varying loads. Conventional LDO regulators use a PNP pass element, the base current of which is directly proportional to the load current through the regulator ($I_B = I_C/\beta$). The TPS703xx uses a PMOS transistor to pass current. Because the gate of the PMOS is voltage driven, operating current is low and stable over the full load range.

pin functions

enable

The \overline{EN} terminal is an input which enables or shuts down the device. If \overline{EN} is at a logic high signal the device is in shutdown mode. When the \overline{EN} goes to voltage low, then the device is enabled.

sequence

The SEQ terminal is an input that programs which output voltage (V_{OUT1} or V_{OUT2}) is turned on first. When the device is enabled and the SEQ terminal is pulled high or left open, V_{OUT2} turns on first and V_{OUT1} remains off until V_{OUT2} reaches approximately 83% of its regulated output voltage. If V_{OUT2} is pulled below 83% (i.e., over load condition) V_{OUT1} is turned off. This terminal has a 6- μ A pullup current to V_{IN1} .

Pulling the SEQ terminal low reverses the power-up order and V_{OUT1} is turned on first. For detail timing diagrams refer to Figures 33 through 39.

DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS
WITH POWER UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS285A – AUGUST 2000 – REVISED OCTOBER 2002

detailed description (continued)

power good (PG1)

The PG1 terminal is an open drain, active high output terminal which indicates the status of the V_{OUT1} regulator. When the V_{OUT1} reaches 95% of its regulated voltage, PG1 goes to a high impedance state. PG1 goes to a low impedance state when V_{OUT1} is pulled below 95% (i.e., over load condition) of its regulated voltage. The open drain output of the PG1 terminal requires a pullup resistor.

manual reset pins ($\overline{MR1}$ and $\overline{MR2}$)

$\overline{MR1}$ and $\overline{MR2}$ are active low input terminals used to trigger a reset condition. When either $\overline{MR1}$ or $\overline{MR2}$ is pulled to logic low, a POR (\overline{RESET}) occurs. These terminals have a 6- μ A pullup current to V_{IN1} . It is recommended that these pins be pulled high to V_{IN} when they are not used.

sense (V_{SENSE1} , V_{SENSE2})

The sense terminals of fixed-output options must be connected to the regulator output, and the connection should be as short as possible. Internally, the sense terminals connect to high-impedance wide-bandwidth amplifiers through resistor-divider networks and noise pickup feeds through to the regulator output. It is essential to route the sense connections in such a way to minimize/avoid noise pickup. Adding RC networks between the V_{SENSE} terminals and V_{OUT} terminals to filter noise is not recommended because it can cause the regulators to oscillate.

FB1 and FB2

FB1 and FB2 are input terminals used for adjustable-output devices and must be connected to the external feedback resistor divider. FB1 and FB2 connections should be as short as possible. It is essential to route them in such a way as to minimize/avoid noise pickup. Adding RC networks between the FB terminals and the V_{OUT} terminals to filter noise is not recommended because it can cause the regulators to oscillate.

\overline{RESET} indicator

\overline{RESET} is an active low, open drain output and requires a pullup resistor for normal operation. When pulled up, \overline{RESET} goes to a high impedance state (i.e. logic high) after a 120 ms delay when all three of the following conditions are met. First, V_{IN1} must be above the undervoltage condition. Second, the manual reset (\overline{MR}) pin must be in a high impedance state. Third, V_{OUT2} must be above approximately 95% of its regulated voltage. To monitor V_{OUT1} , the PG1 output pin can be connected to $\overline{MR1}$ or $\overline{MR2}$.

V_{IN1} and V_{IN2}

V_{IN1} and V_{IN2} are inputs to the regulators.

V_{OUT1} and V_{OUT2}

V_{OUT1} and V_{OUT2} are output terminals of each regulator.

DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS

WITH POWER UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS285A – AUGUST 2000 – REVISED OCTOBER 2002

absolute maximum ratings over operating junction temperature (unless otherwise noted)[†]

Input voltage range [‡] : V_{IN1}	–0.3 V to 7 V
V_{IN2}	–0.3 V to 7 V
Voltage range at \overline{EN}	–0.3 V to 7 V
Output voltage range (V_{OUT1} , V_{SENSE1})	5.5 V
Output voltage range (V_{OUT2} , V_{SENSE2})	5.5 V
Maximum \overline{RESET} , PG1 voltage	7 V
Maximum $\overline{MR1}$, $\overline{MR2}$, and SEQ voltage	V_{IN1}
Peak output current	Internally limited
Continuous total power dissipation	See Dissipation Rating Table
Operating virtual junction temperature range, T_J	–40°C to 150°C
Storage temperature range, T_{stg}	–65°C to 150°C
ESD rating, HBM	2 kV

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

[‡] All voltages are tied to network ground.

DISSIPATION RATING TABLE

PACKAGE	AIR FLOW (CFM)	$T_A \leq 25^\circ\text{C}$	DERATING FACTOR	$T_A = 70^\circ\text{C}$	$T_A = 85^\circ\text{C}$
PWP [§]	0	3.32 W	33.2 mW/°C	1.83 W	1.33 W
	250	TBD W	TBD mW/°C	TBD W	TBD W

[§] This parameter is measured with the recommended copper heat sink pattern on a 4-layer PCB, 2 oz. copper traces on a 4-in × 4-in ground layer. Simultaneous and continuous operation of both regulator outputs at full loads may exceed the power dissipation rating of the PWP package. For more information, refer to the power dissipation and thermal information section at the end of this datasheet, and to TI technical brief SLMA002.

recommended operating conditions

	MIN	MAX	UNIT
Input voltage, V_I [¶]	2.7	6	V
Output current, I_O (regulator 1)	0	1	A
Output current, I_O (regulator 2)	0	2	A
Output voltage range (for adjustable option)	1.22	5.5	V
Operating virtual junction temperature, T_J	–40	125	°C

[¶] To calculate the minimum input voltage for maximum output current, use the following equation: $V_{I(\min)} = V_{O(\max)} + V_{DO(\max \text{ load})}$.

t _{r(RESET)}			Rising edge deglitch		30		μs	
Output low voltage			V _I = 3.5 V, I _{I(RESET)} = 1 mA		0.15		0.4	V
Leakage current			V _{I(RESET)} = 6 V		1		μA	

NOTES: 1. Minimum input operating voltage is 2.7 V or $V_O(\text{typ}) + 1\text{ V}$, whichever is greater. Maximum input voltage is 6 V , minimum output current is 1 mA .

2. If $V_O < 1.8\text{ V}$ then $V_{I\text{max}} = 6\text{ V}$, $V_{I\text{min}} = 2.7\text{ V}$:

$$\text{Line regulation (mV)} = (\%/V) \times \frac{V_O(V_{I\text{max}} - 2.7\text{ V})}{100} \times 1000$$

If $V_O > 2.5\text{ V}$ then $V_{I\text{max}} = 6\text{ V}$, $V_{I\text{min}} = V_O + 1\text{ V}$:

$$\text{Line regulation (mV)} = (\%/V) \times \frac{V_O(V_{I\text{max}} - (V_O + 1))}{100} \times 1000$$

3. $I_O = 1\text{ mA}$ to 1 A for regulator 1 and 1 mA to 2 A for regulator 2.

THERMAL INFORMATION

thermally enhanced TSSOP-24 (PWP – PowerPad™)

The thermally enhanced PWP package is based on the 24-pin TSSOP, but includes a thermal pad [see Figure 33(c)] to provide an effective thermal contact between the IC and the PWB.

Traditionally, surface mount and power have been mutually exclusive terms. A variety of scaled-down TO220-type packages have leads formed as gull wings to make them applicable for surface-mount applications. These packages, however, suffer from several shortcomings: they do not address the very low profile requirements (<2 mm) of many of today's advanced systems, and they do not offer a pin-count high enough to accommodate increasing integration. On the other hand, traditional low-power surface-mount packages require power-dissipation derating that severely limits the usable range of many high-performance analog circuits.

The PWP package (thermally enhanced TSSOP) combines fine-pitch surface-mount technology with thermal performance comparable to much larger power packages.

The PWP package is designed to optimize the heat transfer to the PWB. Because of the very small size and limited mass of a TSSOP package, thermal enhancement is achieved by improving the thermal conduction paths that remove heat from the component. The thermal pad is formed using a lead-frame design (patent pending) and manufacturing technique to provide the user with direct connection to the heat-generating IC. When this pad is soldered or otherwise coupled to an external heat dissipator, high power dissipation in the ultrathin, fine-pitch, surface-mount package can be reliably achieved.

Figure 33. Views of Thermally Enhanced PWP Package

Because the conduction path has been enhanced, power-dissipation capability is determined by the thermal considerations in the PWB design. For example, simply adding a localized copper plane (heat-sink surface), which is coupled to the thermal pad, enables the PWP package to dissipate 2.5 W in free air (reference Figure 35(a), 8 cm² of copper heat sink and natural convection). Increasing the heat-sink size increases the power dissipation range for the component. The power dissipation limit can be further improved by adding airflow to a PWB/IC assembly (see Figures 34 and 35). The line drawn at 0.3 cm² in Figures 34 and 35 indicates performance at the minimum recommended heat-sink size, illustrated in Figure 36.

THERMAL INFORMATION

thermally enhanced TSSOP-24 (PWP – PowerPad™) (continued)

The thermal pad is directly connected to the substrate of the IC, which for the TPS703xx series is a secondary electrical connection to device ground. The heat-sink surface that is added to the PWP can be a ground plane or left electrically isolated. In TO220-type surface-mount packages, the thermal connection is also the primary electrical connection for a given terminal which is not always ground. The PWP package provides up to 24 independent leads that can be used as inputs and outputs (Note: leads 1, 12, 13, and 24 are internally connected to the thermal pad and the IC substrate).

Figure 35. Power Ratings of the PWP Package at Ambient Temperatures of 25°C , 55°C , and 105°C

THERMAL INFORMATION

thermally enhanced TSSOP-24 (PWP – PowerPad™) (continued)

Figure 36 is an example of a thermally enhanced PWB layout for use with the new PWP package. This board configuration was used in the thermal experiments that generated the power ratings shown in Figure 34 and Figure 35. As discussed earlier, copper has been added on the PWB to conduct heat away from the device. $R_{\theta JA}$ for this assembly is illustrated in Figure 34 as a function of heat-sink area. A family of curves is included to illustrate the effect of airflow introduced into the system.

Figure 36. PWB Layout (Including Copper Heatsink Area) for Thermally Enhanced PWP Package

From Figure 34, $R_{\theta JA}$ for a PWB assembly can be determined and used to calculate the maximum power-dissipation limit for the component/PWB assembly, with the equation:

$$P_{D(max)} = \frac{T_{Jmax} - T_A}{R_{\theta JA(system)}} \quad (1)$$

where

T_{Jmax} is the maximum specified junction temperature (150°C absolute maximum limit, 125°C recommended operating limit) and T_A is the ambient temperature.

$P_{D(max)}$ should then be applied to the internal power dissipated by the TPS703xx regulator. The equation for calculating total internal power dissipation of the TPS703xx is:

$$P_{D(total)} = (V_{IN1} - V_{OUT1}) \times I_{OUT1} + V_{IN1} \times \frac{I_Q}{2} + (V_{IN2} - V_{OUT2}) \times I_{OUT2} + V_{IN2} \times \frac{I_Q}{2} \quad (2)$$

Since the quiescent current of the TPS703xx is very low, the second term is negligible, further simplifying the equation to:

$$P_{D(total)} = (V_{IN1} - V_{OUT1}) \times I_{OUT1} + (V_{IN2} - V_{OUT2}) \times I_{OUT2} \quad (3)$$

For the case where $T_A = 55^\circ\text{C}$, airflow = 200 ft/min, copper heat-sink area = 4 cm², the maximum power-dissipation limit can be calculated. First, from Figure 34, we find the system $R_{\theta JA}$ is 50°C/W; therefore, the maximum power-dissipation limit is:

$$P_{D(max)} = \frac{T_{Jmax} - T_A}{R_{\theta JA(system)}} = \frac{125^\circ\text{C} - 55^\circ\text{C}}{50^\circ\text{C/W}} = \text{TBD W} \quad (4)$$

DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS
WITH POWER UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS285A – AUGUST 2000 – REVISED OCTOBER 2002

THERMAL INFORMATION

thermally enhanced TSSOP-24 (PWP – PowerPad™) (continued)

If the system implements a TPS703xx regulator, where $V_I = 5\text{ V}$ and $I_O = 800\text{ mA}$, the internal power dissipation is:

$$P_{D(\text{total})} = (V_{\text{IN1}} - V_{\text{OUT1}}) \times I_{\text{OUT1}} + (V_{\text{IN2}} - V_{\text{OUT2}}) \times I_{\text{OUT2}} \quad (5)$$
$$= (4.3 - 3.3) \times 0.8 + (2.8 - 1.8) \times 1 = 1.8\text{ W}$$

Comparing $P_{D(\text{total})}$ with $P_{D(\text{max})}$ reveals that the power dissipation in this example does not exceed the calculated limit. When it does, one of two corrective actions should be made: raising the power-dissipation limit by increasing the airflow or the heat-sink area, or lowering the internal power dissipation of the regulator by reducing the input voltage or the load current. In either case, the above calculations should be repeated with the new system parameters. This parameter is measured with the recommended copper heat sink pattern on a 4-layer PCB, 2 oz. copper traces on 4-in \times 4-in ground layer. Simultaneous and continuous operation of both regulator outputs at full load may exceed the power dissipation rating of the PWP package.

mounting information

The primary requirement is to complete the thermal contact between the thermal pad and the PWB metal. The thermal pad is a solderable surface and is fully intended to be soldered at the time the component is mounted. Although voiding in the thermal-pad solder-connection is not desirable, up to 50% voiding is acceptable. The data included in Figures 34 and 35 is for soldered connections with voiding between 20% and 50%. The thermal analysis shows no significant difference resulting from the variation in voiding percentage.

Figure 37 shows the solder-mask land pattern for the PWP package. The minimum recommended heat-sink area is also illustrated. This is simply a copper plane under the body extent of the package, including metal routed under terminals 1, 12, 13, and 24.

APPLICATION INFORMATION

sequencing timing diagrams

The following figures provide a timing diagram of how this device functions in different configurations.

application conditions not shown in block diagram:

V_{IN1} and V_{IN2} are tied to the same fixed input voltage greater than the V_{UVLO} ; SEQ is tied to logic low; PG1 is tied to MR2; MR1 is not used and is connected to V_{IN} .

explanation of timing diagrams:

\overline{EN} is initially high; therefore, both regulators are off and PG1 and RESET are at logic low. With SEQ at logic low, when \overline{EN} is taken to logic low, V_{OUT1} turns on. V_{OUT2} turns on after V_{OUT1} reaches 83% of its regulated output voltage. When V_{OUT1} reaches 95% of its regulated output voltage, PG1 (tied to MR2) goes to logic high. When both V_{OUT1} and V_{OUT2} reach 95% of their respective regulated output voltages and both MR1 and MR2 (tied to PG1) are at logic high, RESET is pulled to logic high after a 120 ms delay. When \overline{EN} is returned to logic high, both devices power down and both PG1 (tied to MR2) and RESET return to logic low.

NOTE A: t_1 – Time at which both V_{OUT1} and V_{OUT2} are greater than the PG thresholds and MR1 is logic high.

APPLICATION INFORMATION

input capacitor

For a typical application, a ceramic input bypass capacitor ($0.22\ \mu\text{F} - 1\ \mu\text{F}$) is recommended to ensure device stability. This capacitor should be as close as possible to the input pin. Due to the impedance of the input supply, large transient currents causes the input voltage to droop. If this droop causes the input voltage to drop below the UVLO threshold, the device turns off. Therefore, it is recommended that a larger capacitor be placed in parallel with the ceramic bypass capacitor at the regulator's input. The size of this capacitor depends on the output current, response time of the main power supply, and the main power supply's distance to the regulator. At a minimum, the capacitor should be sized to ensure that the input voltage does not drop below the minimum UVLO threshold voltage during normal operating conditions.

output capacitor

As with most LDO regulators, the TPS703xx requires an output capacitor connected between each OUT and GND to stabilize the internal control loop. The minimum recommended capacitance value for $V_{\text{OUT}1}$ is $22\ \mu\text{F}$ and the ESR (equivalent series resistance) must be between $50\ \text{m}\Omega$ and $800\ \text{m}\Omega$. The minimum recommended capacitance value for $V_{\text{OUT}2}$ is $47\ \mu\text{F}$ and the ESR must be between $50\ \text{m}\Omega$ and $2\ \Omega$. Solid tantalum electrolytic, aluminum electrolytic, and multilayer ceramic capacitors are all suitable, provided they meet the requirements described above. Larger capacitors provide a wider range of stability and better load transient response. Below is a partial listing of surface-mount capacitors usable with the TPS703xx for fast transient response application.

This information, along with the ESR graphs, is included to assist in selection of suitable capacitance for the user's application. When necessary to achieve low height requirements along with high output current and/or high load capacitance, several higher ESR capacitors can be used in parallel to meet the guidelines above.

APPLICATION INFORMATION

programming the TPS70302 adjustable LDO regulator

The output voltage of the TPS70302 adjustable regulators is programmed using external resistor dividers as shown in Figure 45.

Resistors R1 and R2 should be chosen for approximately 50 μ A divider current. Lower value resistors can be used, but offer no inherent advantage and waste more power. Higher values should be avoided as leakage currents at the sense terminal increase the output voltage error. The recommended design procedure is to choose R2 = 30.1 k Ω to set the divider current at approximately 50 μ A and then calculate R1 using:

$$R1 = \left(\frac{V_O}{V_{ref}} - 1 \right) \times R2 \quad (6)$$

where

$V_{ref} = 1.224$ V typ (the internal reference voltage)

**OUTPUT VOLTAGE

Figure 45. TPS70302 Adjustable LDO Regulator Programming

regulator protection

Both TPS703xx PMOS-pass transistors have built-in back diodes that conduct reverse currents when the input voltage drops below the output voltage (e.g., during power down). Current is conducted from the output to the input and is not internally limited. When extended reverse voltage is anticipated, external limiting may be appropriate.

The TPS703xx also features internal current limiting and thermal protection. During normal operation, the TPS703xx regulator 1 limits output current to approximately 1.75 A (typ) and regulator 2 limits output current to approximately 3.8 A (typ). When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. While current limiting is designed to prevent gross device failure, care should be taken not to exceed the power dissipation ratings of the package. If the temperature of the device exceeds 150°C(typ), thermal-protection circuitry shuts it down. Once the device has cooled below 130°C(typ), regulator operation resumes.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and

package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusions. Mold flash and protrusion shall not exceed 0.15 per side.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
