HEF4585B

MSI

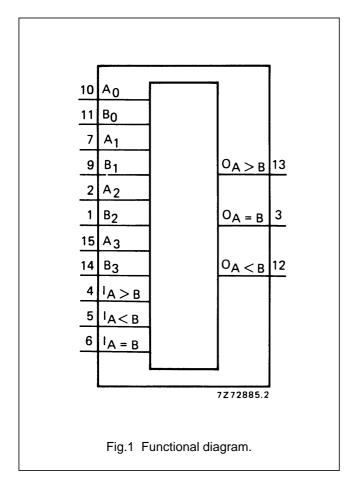

4-bit magnitude comparator

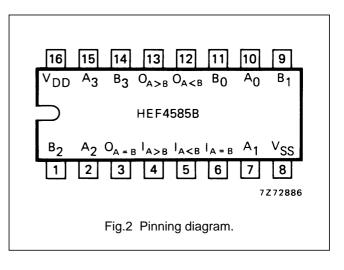

DESCRIPTION

The HEF4585B is a 4-bit magnitude comparator which compares two 4-bit words (A and B), whether they are 'less than', 'equal to', or 'greater than'. Each word has four parallel inputs (A₀ to A₃ and B₀ to B₃); A₃ and B₃ being the most significant inputs. Three outputs are provided; A greater than B (O_{A > B}), A less than B (O_{A < B}) and A equal to B (O_{A = B}). Three expander inputs (I_{A > B}, I_{A < B} and I_{A = B}) allow cascading of the devices without external gates.

For proper compare operation the expander inputs to the least significant position must be connected as follows: $I_{A = B} = I_{A > B} = HIGH$, $I_{A < B} = LOW$. For words greater than 4-bits, units can be cascaded by connecting outputs $O_{A < B}$ and $O_{A = B}$ to the corresponding inputs of the next significant comparator (input $I_{A > B}$ is connected to a HIGH).

Operation is not restricted to binary codes, the devices will work with any monotonic code. The function table describes the operation of the device under all possible logic conditions.

Notes

- 1. H = HIGH state (the more positive voltage)
 - L = LOW state (the less positive voltage)
 - X = state is immaterial

The upper 11 lines describe the normal operation under all conditions that will occur in a single device or in a serial expansion scheme.

The lower 2 lines describe the operation under abnormal conditions on the cascading inputs. These conditions occur when the parallel expansion technique is used.

APPLICATION INFORMATION

Some examples of applications for the HEF4585B are:

- Process controllers.
- Servo-motor control.
