

# Low-Power, Rail-to-Rail Output, 12-Bit Serial Input DIGITAL-TO-ANALOG CONVERTER

## FEATURES

- **microPOWER OPERATION:** 135 $\mu$ A at 5V
- **POWER-DOWN:** 200nA at 5V, 50nA at 3V
- **POWER SUPPLY:** +2.7V to +5.5V
- **TESTED MONOTONIC BY DESIGN**
- **POWER-ON RESET TO 0V**
- **THREE POWER-DOWN FUNCTIONS**
- **LOW POWER SERIAL INTERFACE WITH SCHMITT-TRIGGERED INPUTS**
- **ON-CHIP OUTPUT BUFFER AMPLIFIER, RAIL-TO-RAIL OPERATION**
- **SYNC INTERRUPT FACILITY**
- **SOT23-6 AND MSOP-8 PACKAGES**

## APPLICATIONS

- **PORTABLE BATTERY-POWERED INSTRUMENTS**
- **DIGITAL GAIN AND OFFSET ADJUSTMENT**
- **PROGRAMMABLE VOLTAGE AND CURRENT SOURCES**

## DESCRIPTION

The DAC7512 is a low-power, single, 12-bit buffered voltage output Digital-to-Analog Converter (DAC). Its on-chip precision output amplifier allows rail-to-rail output swing to be achieved. The DAC7512 uses a versatile three-wire serial interface that operates at clock rates up to 30MHz and is compatible with standard SPI™, QSPI™, Microwire™, and DSP interfaces.

The reference for the DAC7512 is derived from the power supply, resulting in the widest dynamic output range possible. The DAC7512 incorporates a power-on reset circuit that ensures that the DAC output powers up at 0V and remains there until a valid write takes place in the device. The DAC7512 contains a power-down feature, accessed over the serial interface, that can reduce the current consumption of the device to 50nA at 5V.

The low power consumption of this part in normal operation makes it ideally suited to portable battery-operated equipment. The power consumption is 0.7mW at 5V reducing to 1 $\mu$ W in power-down mode.

The DAC7512 is available in a SOT23-6 package and an MSOP-8 package.

SPI and QSPI are registered trademarks of Motorola.  
Microwire is a registered trademark of National Semiconductor.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

$V_{DD}$ to GND .....	-0.3V to +6V
Digital Input Voltage to GND .....	-0.3V to $V_{DD} + 0.3V$
$V_{OUT}$ to GND .....	-0.3V to $V_{DD} + 0.3V$
Operating Temperature Range .....	-40°C to +105°C
Storage Temperature Range .....	-65°C to +150°C
Junction Temperature Range ( $T_J$ max) .....	+150°C
SOT23 Package:	
Power Dissipation .....	$(T_J \text{ max} - T_A) / \theta_{JA}$
$\theta_{JA}$ Thermal Impedance .....	240°C/W
Lead Temperature, Soldering:	
Vapor Phase (60s) .....	+215°C
Infrared (15s) .....	+220°C
MSOP Package:	
Power Dissipation .....	$(T_J \text{ max} - T_A) / \theta_{JA}$
$\theta_{JA}$ Thermal Impedance .....	206°C/W
$\theta_{JC}$ Thermal Impedance .....	44°C/W

Vapor Phase (60s) .....	+215°C
Infrared (15s) .....	+220°C

NOTE: (1) Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

## PACKAGE/ORDERING INFORMATION

PRODUCT	MINIMUM RELATIVE ACCURACY (LSB)	DIFFERENTIAL NONLINEARITY (LSB)	PACKAGE-LEAD	PACKAGE DESIGNATOR <sup>(1)</sup>	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER <sup>(1)</sup>	TRANSPORT MEDIA, QUANTITY
DAC7512E	±8	±1	MSOP-8	DGK	-40°C to +105°C	D12E	DAC7512E/250	Tape and Reel, 250
"	"	"	"	"	"	"	DAC7512E/2K5	Tape and Reel, 2500
DAC7512N	±8	±1	SOT23-6	DBV	-40°C to +105°C	D12N	DAC7512N/250	Tape and Reel, 250
"	"	"	"	"	"	"	DAC7512N/3K	Tape and Reel, 3000

NOTES: (1) For the most current specifications and package information, refer to our web site at [www.ti.com](http://www.ti.com). (2) Models with a slash (/) are available only in Tape and Reel in the quantities indicated (e.g., /2K5 indicates 2500 devices per reel). Ordering 2500 pieces of "DAC7512E/2K5" will get a single 2500-piece Tape and Reel.

## PIN CONFIGURATIONS

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PIN DESCRIPTION (SOT23-6)

PIN	NAME	DESCRIPTION
1	$V_{OUT}$	Analog output voltage from DAC. The output amplifier has rail-to-rail operation.
2	GND	Ground reference point for all circuitry on the part.
3	$V_{DD}$	Power Supply Input, +2.7V to 5.5V.
4	$D_{IN}$	Serial Data Input. Data is clocked into the 16-bit input shift register on the falling edge of the serial clock input.
5	SCLK	Serial Clock Input. Data can be transferred at rates up to 30MHz.
6	$\overline{SYNC}$	Level triggered control input (active LOW). This is the frame synchronization signal for the input data. When $\overline{SYNC}$ goes LOW, it enables the input shift register and data is transferred in on the falling edges of the following clocks. The DAC is updated following the 16th clock cycle unless $\overline{SYNC}$ is taken HIGH before this edge, in which case the rising edge of $\overline{SYNC}$ acts as an interrupt and the write sequence is ignored by the DAC7512.

## DAC7512N LOT TRACE LOCATION

# TIMING CHARACTERISTICS(1, 2)

$V_{DD} = +2.7V$  to  $+5.5V$ ; all specifications  $-40^{\circ}C$  to  $+105^{\circ}C$ , unless otherwise noted.

PARAMETER	DESCRIPTION	CONDITIONS	DAC7512E, N			UNITS
			MIN	TYP	MAX	
$t_1^{(3)}$	SCLK Cycle Time	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	50 33			ns ns
$t_2$	SCLK HIGH Time	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	13 13			ns ns
$t_3$	SCLK LOW Time	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	22.5 13			ns ns
$t_4$	$\overline{SYNC}$ to SCLK Rising Edge Setup Time	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	0 0			ns ns
$t_5$	Data Setup Time	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	5 5			ns ns
$t_6$	Data Hold Time	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	4.5 4.5			ns ns
$t_7$	SCLK Falling Edge to $\overline{SYNC}$ Rising Edge	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	0 0			ns ns
$t_8$	Minimum $\overline{SYNC}$ HIGH Time	$V_{DD} = 2.7V$ to $3.6V$ $V_{DD} = 3.6V$ to $5.5V$	50 33			ns ns

NOTES: (1) All input signals are specified with  $t_R = t_F = 5ns$  (10% to 90% of  $V_{DD}$ ) and timed from a voltage level of  $(V_{IL} + V_{IH})/2$ . (2) See Serial Write Operation timing diagram, below. (3) Maximum SCLK frequency is 30MHz at  $V_{DD} = +3.6V$  to  $+5.5V$  and 20MHz at  $V_{DD} = +2.7V$  to  $+3.6V$ .

## THEORY OF OPERATION

### DAC SECTION

The DAC7512 is fabricated using a CMOS process. The architecture consists of a string DAC followed by an output buffer amplifier. Since there is no reference input pin, the power supply ( $V_{DD}$ ) acts as the reference. Figure 1 shows a block diagram of the DAC architecture.

FIGURE 1. DAC7512 Architecture.

The input coding to the DAC7512 is straight binary, so the ideal output voltage is given by:

$$V_{OUT} = V_{DD} \cdot \frac{D}{4096}$$

where  $D$  = decimal equivalent of the binary code that is loaded to the DAC register; it can range from 0 to 4095.

### RESISTOR STRING

The resistor string section is shown in Figure 2. It is simply a string of resistors, each of value  $R$ . The code loaded into the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier by closing one of the switches connecting the string to the amplifier. It is tested monotonic because it is a string of resistors.

FIGURE 2. Resistor String.

### OUTPUT AMPLIFIER

The output buffer amplifier is capable of generating rail-to-rail voltages on its output which gives an output range of 0V to  $V_{DD}$ . It is capable of driving a load of 2kΩ in parallel with 100pF to GND. The source and sink capabilities of the output amplifier can be seen in the typical characteristics. The slew rate is 1V/μs with a half-scale settling time of 8μs with the output unloaded.

# SERIAL INTERFACE

The DAC7512 has a three-wire serial interface ( $\overline{\text{SYNC}}$ , SCLK, and  $D_{\text{IN}}$ ), which is compatible with SPI, QSPI, and Microwire interface standards as well as most Digital Signal Processors (DSPs). See the Serial Write Operation timing diagram for an example of a typical write sequence.

The write sequence begins by bringing the  $\overline{\text{SYNC}}$  line LOW. Data from the  $D_{\text{IN}}$  line is clocked into the 16-bit shift register on the falling edge of SCLK. The serial clock frequency can be as high as 30MHz, making the DAC7512 compatible with high-speed DSPs. On the 16th falling edge of the serial clock, the last data bit is clocked in and the programmed function is executed (i.e., a change in DAC register contents and/or a change in the mode of operation).

At this point, the  $\overline{\text{SYNC}}$  line may be kept LOW or brought HIGH. In either case, it must be brought HIGH for a minimum of 33ns before the next write sequence so that a falling edge of  $\overline{\text{SYNC}}$  can initiate the next write sequence. Since the  $\overline{\text{SYNC}}$  buffer draws more current when the  $\overline{\text{SYNC}}$  signal is HIGH than it does when it is LOW,  $\overline{\text{SYNC}}$  should be idled LOW between write sequences for lowest power operation of the part. As mentioned above, however, it must be brought HIGH again just before the next write sequence.

## INPUT SHIFT REGISTER

The input shift register is 16 bits wide, as shown in Figure 3. The first two bits are "don't cares". The next two bits (PD1 and PD0) are control bits that control which mode of operation the part is in (normal mode or one of three power-down modes). There is a more complete description of the various modes in the Power-Down Modes section. The next 12 bits are the data bits. These are transferred to the DAC register on the 16th falling edge of SCLK.

## $\overline{\text{SYNC}}$ INTERRUPT

In a normal write sequence, the  $\overline{\text{SYNC}}$  line is kept LOW for at least 16 falling edges of SCLK and the DAC is updated on the 16th falling edge. However, if  $\overline{\text{SYNC}}$  is brought HIGH before the 16th falling edge, this acts as an interrupt to the

write sequence. The shift register is reset and the write sequence is seen as invalid. Neither an update of the DAC register contents or a change in the operating mode occurs, as shown in Figure 4.

## POWER-ON RESET

The DAC7512 contains a power-on reset circuit that controls the output voltage during power-up. On power-up, the DAC register is filled with zeros and the output voltage is 0V; it remains there until a valid write sequence is made to the DAC. This is useful in applications where it is important to know the state of the output of the DAC while it is in the process of powering up.

## POWER-DOWN MODES

The DAC7512 contains four separate modes of operation. These modes are programmable by setting two bits (PD1 and PD0) in the control register. Table I shows how the state of the bits corresponds to the mode of operation of the device.

DB13	DB12	OPERATING MODE
0	0	Normal Operation
0	1	Power-Down Modes: Output 1kΩ to GND
1	0	Output 100kΩ to GND
1	1	High-Z

TABLE I. Modes of Operation for the DAC7512.

When both bits are set to 0, the part works normally with its normal power consumption of 135μA at 5V. However, for the three power-down modes, the supply current falls to 200nA at 5V (50nA at 3V). Not only does the supply current fall, but the output stage is also internally switched from the output of the amplifier to a resistor network of known values. This has the advantage that the output impedance of the part is known while the part is in power-down mode. There are three different options. The output is connected internally to GND through a 1kΩ resistor, a 100kΩ resistor, or it is left open-circuited (High-Z). See Figure 5 for the output stage.

FIGURE 3. Data Input Register.

FIGURE 4.  $\overline{\text{SYNC}}$  Interrupt Facility.

FIGURE 5. Output Stage During Power-Down.

All linear circuitry is shut down when the power-down mode is activated. However, the contents of the DAC register are unaffected when in power-down. The time to exit power-down is typically 2.5 $\mu$ s for  $V_{DD} = 5V$  and 5 $\mu$ s for  $V_{DD} = 3V$ . See the Typical Characteristics for more information.

## MICROPROCESSOR INTERFACING

### DAC7512 TO 8051 INTERFACE

Figure 6 shows a serial interface between the DAC7512 and a typical 8051-type microcontroller. The setup for the interface is as follows: TXD of the 8051 drives SCLK of the DAC7512, while RXD drives the serial data line of the part. The  $\overline{\text{SYNC}}$  signal is derived from a bit programmable pin on the port. In this case, port line P3.3 is used. When data is to be transmitted to the DAC7512, P3.3 is taken LOW. The 8051 transmits data only in 8-bit bytes; thus only eight falling clock edges occur in the transmit cycle. To load data to the DAC, P3.3 is left LOW after the first eight bits are transmitted, and a second write cycle is initiated to transmit the second byte of data. P3.3 is taken HIGH following the completion of this cycle. The 8051 outputs the serial data in a format which has the LSB first. The DAC7512 requires its data with the MSB as the first bit received. The 8051 transmit routine must therefore take this into account, and "mirror" the data as needed.

FIGURE 6. DAC7512 to 80C51/80L51 Interface.

### DAC7512 TO MICROWIRE™ INTERFACE

Figure 7 shows an interface between the DAC7512 and any Microwire compatible device. Serial data is shifted out on the falling edge of the serial clock and is clocked into the DAC7512 on the rising edge of the SK signal.

FIGURE 7. DAC7512 to Microwire Interface.

### DAC7512 TO 68HC11 INTERFACE

Figure 8 shows a serial interface between the DAC7512 and the 68HC11 microcontroller. SCK of the 68HC11 drives the SCLK of the DAC7512, while the MOSI output drives the serial data line of the DAC. The  $\overline{\text{SYNC}}$  signal is derived from a port line (PC7), similar to what was done for the 8051.

FIGURE 8. DAC7512 to 68HC11 Interface.

The 68HC11 should be configured so that its CPOL bit is a 0 and its CPHA bit is a 1. This configuration causes data appearing on the MOSI output is valid on the falling edge of SCK. When data is being transmitted to the DAC, the  $\overline{\text{SYNC}}$  line is taken LOW (PC7). Serial data from the 68HC11 is transmitted in 8-bit bytes with only eight falling clock edges occurring in the transmit cycle. Data is transmitted MSB first. In order to load data to the DAC7512, PC7 is left LOW after the first eight bits are transferred, and a second serial write operation is performed to the DAC and PC7 is taken HIGH at the end of this procedure.

## APPLICATIONS

### USING REF02 AS A POWER SUPPLY FOR THE DAC7512

Due to the extremely low supply current required by the DAC7512, an alternative option is to use a REF02 +5V precision voltage reference to supply the required voltage to the part, see Figure 9. This is especially useful if the power supply is too noisy or if the system supply voltages are at some value other than 5V. The REF02 will output a steady supply voltage for the DAC7512. If the REF02 is used, the current it needs to supply to the DAC7512 is 135 $\mu$ A. This is with no load on the output of the DAC. When the DAC output

FIGURE 9. REF02 as Power Supply to DAC7512.

is loaded, the REF02 also needs to supply the current to the load. The total current required (with a 5kΩ load on the DAC output) is:

$$135\mu\text{A} + (5\text{V}/5\text{k}\Omega) = 1.14\text{mA}$$

The load regulation of the REF02 is typically 0.005%/mA, which results in an error of 285µV for the 1.14mA current drawn from it. This corresponds to a 0.2LSB error.

### BIPOLAR OPERATION USING THE DAC7512

The DAC7512 has been designed for single-supply operation but a bipolar output range is also possible using the circuit in Figure 10. The circuit shown will give an output voltage range of ±5V. Rail-to-rail operation at the amplifier output is achievable using an OPA340 as the output amplifier.

The output voltage for any input code can be calculated as follows:

$$V_O = \left[ V \cdot \left( \frac{D}{4096} \right) \cdot \left( \frac{R_1 + R_2}{R_1} \right) - V_{DD} \cdot \left( \frac{R_2}{R_1} \right) \right]$$

where D represents the input code in decimal (0 - 4095).

With  $V_{DD} = 5\text{V}$ ,  $R_1 = R_2 = 10\text{k}\Omega$ :

$$V_O = \left( \frac{10 \cdot D}{4096} \right) - 5\text{V}$$

FIGURE 10. Bipolar Operation with the DAC7512.

This is an output voltage range of ±5V with 000<sub>H</sub> corresponding to a -5V output and FFF<sub>H</sub> corresponding to a +5V output.

## LAYOUT

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies.

As the DAC7512 offers single-supply operation, it will often be used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it will be to achieve good performance from the converter.

Due to the single ground pin of the DAC7512, all return currents, including digital and analog return currents, must flow through the GND pin. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power entry point of the system.

The power applied to  $V_{DD}$  should be well regulated and low noise. Switching power supplies and DC/DC converters will often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes as their internal logic switches states. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. This is particularly true for the DAC7512, as the power supply is also the reference voltage for the DAC.

As with the GND connection,  $V_{DD}$  should be connected to a +5V power supply plane or trace that is separate from the connection for digital logic until they are connected at the power entry point. In addition, the 1µF to 10µF and 0.1µF bypass capacitors are strongly recommended. In some situations, additional bypassing may be required, such as a 100µF electrolytic capacitor or even a "Pi" filter made up of inductors and capacitors—all designed to essentially low-pass filter the +5V supply, removing the high-frequency noise.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
